$S < A$: subdivision of $\alpha \to b$

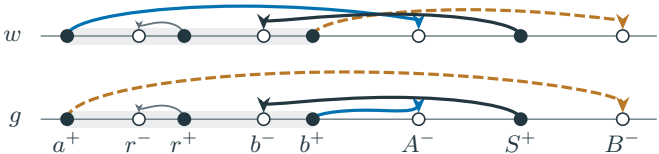

$$E(w) = E(g) - \{\alpha \to b\} + \{\alpha \to \beta,\ \beta \to b\}$$

$$\mathrm{adv}(\alpha, b) = \mathrm{adv}(\alpha, \beta) + \mathrm{adv}(\beta, b)$$

The shaded band is the open swept arc from a^+ to b^+: it contains b^- and fixed positions only, whose chords cross nothing.

$A \le S < B$: a new winding-one triangle

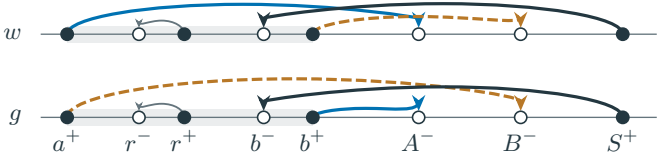

$$E(w) = E(g) + \{b \to \alpha,\ \alpha \to \beta,\ \beta \to b\}$$

advances $A - b$, $B - A$, $b + n - B$ sum to n

One lifted turn from a^+. Only the entries of α and β move, between a^+ and b^+; the regime is the place of the entry S^+ of the chord of b.

$B \le S$: subdivision of $b \to \beta$

$$E(w) = E(g) - \{b \to \beta\} + \{b \to \alpha,\ \alpha \to \beta\}$$

$$\mathrm{adv}(b, \beta) = \mathrm{adv}(b, \alpha) + \mathrm{adv}(\alpha, \beta)$$

Chords run from entry to exit (arrowhead at the exit) and cross exactly when their endpoints interlace. Upper line: w; lower line: g. Chord of α blue, of β ochre dashed, of b black.
